The dynamic stability of parallel turbogenerators when short circuits occur is always higher than that calculated by normal standard means. The greatest difference occurs when serious short circuits occur at point which are, electrically, fairly near the terminals of (Engineering--Elecrrical, TT, v. 5, no. 5) (over)

the turbogenerators. The basic cause is that, in standard calculations, the electromagnetic torques on the turbogenerator shafts are not taken into account. These are caused by the aperiodic component of the stator current, which occurs at the moment of a short circuit or other abrupt change in conditions. After turbogenerators of a thermal station have fallen out of synchronism, resynchronization, to bring them into line with the other generators of the stations in the system, can be carried out in conditions like those examined here, even when the total power of the turbogenerators that have fallen out of step somewhat exceeds the power which, in a protracted period, can be transmitted over the remaining operating lines.
